

What is claimed is:

1. A multiple purpose pocket tool, comprising:

2 a) an elongated housing having a longitudinal axis, first and second opposite ends, first  
3 and second sidewalls positioned in spaced, parallel relation to one another and bridged by a  
4 planar wall extending perpendicularly thereacross, and an end wall extending across said first  
5 end, said first and second sidewalls, planar wall and end wall together defining an internal cavity,  
6 said first sidewall including first and second apertures formed therethrough adjacent to said first  
7 end;

8 b) a plurality of elongated tools each having first proximal and distal ends, top and  
9 bottom edges, and first and second slots formed transversely across each of said top and bottom  
10 edges, respectively, adjacent said first proximal ends, said ancillary tools being pivotally attached  
11 to said second end of said housing at said first proximal ends for selective, independent  
12 movement between terminal open and closed positions;

13 c) an elongated cover plate having second proximal and distal ends, third and fourth  
14 sidewalls positioned in spaced, parallel relation to one another and bridged by a second planar  
15 wall, said second planar wall including a flange extending downwardly from said second distal  
16 end thereof, said third sidewall including an inwardly facing protrusion formed thereon, adjacent  
17 said second proximal end, said cover plate being pivotally attached to said first end of said  
18 housing for selective movement between terminal open and closed positions;

19 d) means for locking said cover plate in its said terminal open position; and

20 e) means for locking said cover plate in its said terminal closed position.
